METHOD OF AND APPARATUS FOR MAKING ROD-LIKE FILLERS FOR SMOKERS' PRODUCTS

ABSTRACT

A mixture of long and short tobacco particles is sifted in the hopper of a cigarette maker to segregate the short particles from the long particles. into a continuous stream and particles are converted the short particles are gathered into a series of discrete, preferably metered, batches which are heterogeneously distributed in longitudinally spaced apart of the stream. The latter is thereupon portions converted into a rod-like filler which is draped into a web of cigarette paper or other wrapping material to form therewith a continuous tobacco-containing rod. rod is severed between successive batches or successive groups of batches so that each discrete cigarette contains at least one batch of short tobacco particles.
